DynaPass Wireless Secure Access official finalist in The Wireless Broadband Innovation Awards 2007

Stockholm, Sweden. The Wireless Broadband innovation Awards are the independent awards for users and service providers of wireless broadband worldwide (www.wbiaward.com). DynaPass Wireless Secure Access from the Swedish communication and security developer April System Design is one of four official finalists in the **Best Wireless Broadband Security Innovation** category 2007.

"This is a strong push for dynamic passwords over SMS and a wonderful recognition of DynaPass", says Björn Karlsson, CEO April System Design. "This recognition will also accelerate our current recruitment of partners around the world" continues Karlsson.

DynaPass is an off the shelf product which provides a dynamic password solution to existing systems in Windows environments and to systems authenticating access through Active Directory via Radius. It delivers the passwords over SMS to any GSM phone or by email according to centrally defined policies. The trigger to send a new password can be either time dependent (i.e. every Monday by 03.15 pm), an SMS or a call to a busy number which is free in most networks. DynaPass is a two factor solution using a secret prefix shared between the server and the user and is based on an approved US patent (no 6,993,658).

Going from static to dynamic passwords is a quick way to drastically increase security in any private network or online service. Such solutions often include a token device and are typically expensive to install and manage. And they require the users to carry on yet another thing. DynaPass is a robust well integrated solution, quick to install and easy to manage and use. It's a highly affordable way to get the advantages of dynamic or one time passwords.
